

EE 2004

Week 10 Homework

1. Find the locations of the flag bit, enable bit and priority bit for the following interrupt sources (i.e., Which SFR are they located? Which bit?). Please refer to the Appendix for SFRs involved in interrupts.
 - a. Timer 0
 - b. Timer 1
 - c. Timer 2
2. Show the instructions needed to enable the Timer0 interrupt in the following situations:
 - a. Interrupt priority is disabled.
 - b. Interrupt priority is enabled, and Timer0 interrupt is a high-priority interrupt.
 - c. Interrupt priority is enabled, and Timer0 interrupt is a low-priority interrupt.
3. Where the PC will be redirected if a high-priority interrupt is triggered? If we want to put the entire interrupt service routine (ISR) in the interrupt vector for a high priority interrupt source, what is the maximum size of this ISR in bytes? What would we do if the size of the ISR is larger?
4. Why do we put a goto instruction at program memory address 0?
5. With a single instruction, disable all the interrupts.
6. Which bits are required to be enabled if we want to enable Timer1 interrupt as a low-priority interrupt?
7. Explain what happens if Interrupt B is activated while the PIC18 is serving Interrupt A (i.e., while the the ISR associated with Interrupt A is being executed) under the following five situations:
 - a. Interrupt priority is disabled.
 - b. Interrupt priority is enabled. Interrupt A&B are both high-priority interrupts.
 - c. Interrupt priority is enabled. Interrupt A&B are both low-priority interrupts.
 - d. Interrupt priority is enabled. Interrupt A is a high-priority interrupt, whereas B is a low-priority interrupt.
 - e. Interrupt priority is enabled. Interrupt A is a low-priority interrupt, whereas B is a high-priority interrupt.
8. Explain why we cannot use `return` instead of `retfie` as the last instruction of an ISR.
